

STRATEGY 3: THE ELEVATED WALKWAY AND BIRD HIDE TO REDUCE THE INTERFERENCE OF HUMAN ACTIVITIES ON THE SITE.

The elevated walkway can be built in accordance with the terrain, avoiding the core water bodies and vegetation areas of the wetland, and protecting the surface micro-topography and hydrological structure from being destroyed; while the Bird Hide is set up at observation points where bird activities are active, integrating with the native vegetation, providing a good viewing perspective while respecting the habitat behavior of wild species.
